How I developed my random test:

1. I first created the makefile to compile the code with.

2. Then, starting with the "testme.c" file provided by the instructor, I wrote code to generate a random character in the inputChar() function. I did this by generating a random number between 0 and the highest value in the ASCII table which may be sought by the program (126).

3. Next I wrote code for the inputString() function. I created a loop which calls the inputChar() function for each position in the string. That way each character in the string is random.

4. Finally, I debugged and tested the program on the OSU "Flip" server.
